

Blocks 块

Overview 概述

Blocks let developers create flexible layouts by breaking down sections into smaller, reusable pieces of Liquid. Each block has its own set of settings, and can be added, removed, and reordered within a section. 块允许开发人员通过将部分模板重写的、可重用的 Liquid 部分来创建灵活的布局。每个块都有自己的设置，可以在分区内添加、删除和重新排序。

- There are three types of blocks:
- 有三种类型的块：
- Theme blocks: Created as their own Liquid files in the /blocks/ folder, and re-usable across multiple sections with the theme. 主题块：在 /blocks/ 文件夹中创建为自己的 Liquid 文件，并可与主题在多个部分中重复使用。
 - Section blocks: Created within a section's Liquid file and are limited to use within that section. 分区块：在分区的 Liquid 文件中创建，仅限于在该分区内使用。
 - App blocks: Provided by apps installed on a merchant's shop. 应用块：由商家商店中安装的应用提供。

Theme blocks 主题块

Theme blocks give you the most flexibility when building sections. As a developer you can: 主题块在构建部分时为部提供了最大的灵活性。作为开发人员，您可以：

- Let merchants add any available block 允许商家添加任何可用的区块
- Restrict sections to specific block types 将部分限制为特定块类型
- Enable blocks to nest inside other blocks 使块嵌套在其他块内
- Create "static blocks" that stay in appear in a specific part of the code, within their parent block or section. Static blocks can be hidden by merchants, but not deleted. 创建保留在代码的特定部分、其父级部分中的“静态块”。静态块可以由商家隐藏，但不能删除。

For example, imagine building a slideshow section. You might: 例如，想象一下构建一个幻灯片部分。你可能会：

- Limit it to only accept slide blocks 将其限制为仅接受滑块
- Let each Slide block contain any other block type available within the theme, or provided by an app 让每个幻灯片块包含主题中可用的或应用程序提供的任何其他块类型
- Add a static "Slideshow Controls" block that stays locked in place 添加一个静态的“幻灯片控件”块，该块保持锁定在原位

This gives merchants the freedom to customize slide content while keeping navigation controls consistent. 这使商家可以自由自定义幻灯片内容，同时保持导航控件的一致性。

Section blocks 分区块

There are a number of limitations to Section blocks: 侧面块有许多限制：

- They only work in the section they're defined within and can't be used elsewhere. 它们仅在定义它们的部分中工作，不能在其他地方使用。
- They only support a single level of hierarchy, and cannot be nested. 它们仅支持单一层次结构，并且不能嵌套。
- They can not currently be used in the same section as Theme blocks. 它们目前不能与主题块在同一部分中使用。

Section blocks are defined directly within a section's Liquid file, and configured within the section's {X schema } tag. 分区块直接在分区的 Liquid 文件中定义，并在分区的 {X schema } 标签中进行配置。

App blocks 应用块

App blocks allow merchants to add app-specific functionality to your theme, such as reviews, ratings, or custom forms; they are defined by the Shopify apps that a merchant installs on their shop. App blocks can be added to any section (or Theme Block) within a theme that has added support in it's schema file. For example, in our Slideshow example, you may have {blocks}/slide.liquid To add support for App Blocks, you would write: 应用块允许商家向您的主题添加特定应用的功能，例如评论、评分或自定义表单。它们由商家在其商店中安装的 Shopify 应用定义。可以将应用块添加到主题中已在其架构文件中添加支持的任何部分（或主题块）。例如，在我们的幻灯片示例中，您可能有 {blocks}/slide.liquid 像添加对应用程序块的支持，您可以编写：

```
1 {X schema X}
2 {
3   "name": "Slide",
4   "blocks": [{ "type": "theme" }, { "type": "app" }],
5 }
6 // Rest of your Schema code
```

Theme blocks vs Snippets 主题块与片段

If you are not familiar with snippets, start [here](#) first. 如果您不熟悉代码片段，请先从[这里](#)开始。

Theme blocks and snippets both help you reuse code, but serve different purposes. Theme blocks: 主题块和代码片段都可以帮您重用代码，但用途不同。主题块：

- Show settings in the theme editor 在主题编辑器中显示设置
- Let merchants customize each instance 让商家自定义每个实例
- Access their parent section and global objects 访问其父部分和全局对象
- Cannot receive variables from parent code 无法从父代码接收变量

Snippets: 片段：

- Handle repeatable markup without merchant customization 处理可重复的加价，无需商家定制
- Accept variables from their parent code 接受父代码中的变量
- Don't show in the theme editor 不显示在主题编辑器中

Often you'll use both together. For example, a product card might use: 通常，您会同时使用两者。例如，产品卡可能使用：

- Theme blocks for the overall structure and settings 整体结构和设置的主题块
- Snippets for individual pieces of markup and templating logic that are re-used across many other blocks 在许多其他块中重复使用的单个标记和模板逻辑片段

AI generated theme blocks AI 生成的主题块

Shopify themes can be extended with custom blocks generated using [Shopify Magic](#), directly within the theme editor (for eligible merchants). This feature allows users to describe a desired block in plain text, and Shopify Magic generates the corresponding Liquid code, including the necessary HTML structure, potential CSS/JavaScript, and the JSON schema definition. Shopify 模板可以直接在模板编辑器中使用使用 [Shopify Magic](#) 生成的自定义块进行扩展（适用于符合条件的商家）。此功能允许用户以纯文本描述所需的块。Shopify Magic 会生成相应的 Liquid 代码，包括必要的 HTML 结构、潜在的 CSS/JavaScript 和 JSON 架构定义。

From a developer perspective, these AI-generated blocks are [theme blocks](#). 从开发者的角度来看，这些 AI 生成的块就是主题块。

- They are stored in the /blocks/ folder alongside other theme blocks. 它们与其他主题块一起存储在 /blocks/ 文件夹中。
- They can be added to any section (or theme block) within a theme that supports theme blocks. 它们可以添加到支持主题块的主题中的任何部分（或主题块）。
